

## Precision Quad SPDT Analog Switch

### DESCRIPTION

The DG333A, DG333AL consist of four independently controlled single-pole double-throw analog switches. These monolithic switch is designed to control analog signals with a high degree of accuracy. The DG333A, DG333AL minimize measurement errors by offering low on-resistance ( $25\ \Omega$  typ.), low leakage ( $20\ \text{pA}$  typ.) and low charge injection performance. The DG333AL features micro-power operation ( $< 1\ \mu\text{W}$  typ.). This is ideal for battery operated systems. Pin 15 is not connected on the DG333A.

An improved charge injection compensation design minimizes switching transients. These switches can handle up to  $\pm 22\ \text{V}$  signals and have an improved continuous current of  $30\ \text{mA}$ .

The DG333A, DG333AL is fabricated in Vishay Siliconix's proprietary HVSG-2 CMOS process, resulting in higher speed and lower power consumption. An epitaxial layer prevents latchup. Each switch conducts equally well in both directions when on. When off, they block voltages up to the power-supply levels.

- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing
- Guaranteed by design, not subject to production test
- $V_{\text{IN}}$  = input voltage to perform proper function
- On-resistance match and flatness are guaranteed only for bipolar supply operation

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## APPLICATIONS

### Band-Pass Switched Capacitor Filter

Single-pole double-throw switches are a common element for switched capacitor networks and filters. The fast switching times and low leakage of the DG333A, DG333AL allow for higher clock rates and consequently higher filter operating frequencies. Figure 8 shows two capacitors being switched.

The DG333A, DG333AL is capable of switching four capacitors.
